

# READY Mini Concentrator

Read what you need

By combining your existing drive-by solution with READY Mini Concentrators placed at strategic customers or at strategic locations in your supply area, you can enrich your regular readings used for billing with more detailed information. A READY Mini Concentrator provides a simple setup, whether you need to read only a handful of meters in remote areas, want to supply selected customers with better insights on consumption, or need extra frequent data from strategic sensors and meters.

## Improved customer service

### Detailed insights helps you improve customer service

When it comes to customer service, one size does not fit all. Some customers demand extra services or deeper insights into their own consumption. With the READY Mini Concentrator, you can provide both private consumers and strategic commercial customers with the information they require and hereby improve satisfaction and customer service levels.

### Transparency for private households

With the READY Mini Concentrator you can provide single consumers with a simple and cost-effective solution that delivers data from their meters directly to an app\*, that lets your customers access data on their own, without taking up valuable time of the utility employees.

This is especially useful if customers need meter data from summerhouses or other properties they do not attend regularly or if the customer is interested in monitoring their own consumption. It is also a great tool for avoiding disputes or if customers have questions regarding their bill, since they get a clear overview of their own consumption.

*\* READY Mini Concentrator can provide meter data to consumers via a user portal or consumer app.*

## A more transparent distribution network

### Prevent leakages and water loss

By installing READy Mini Concentrators, strategic industrial and commercial customers can follow their own consumption. By getting frequent data from the meter, leakages can be detected faster which makes it easier to prevent water loss and lower the costs of potential consequential damage.

### Instant access to data from strategically important meters

With the READy Mini Concentrator, you can combine your mobile meter reading with network-based readings of strategically important meters without the cost and planning required to establish a full communications network for your entire distribution area.

### Monitor the flow and lower the water loss

Install READy Mini Concentrators in pump stations and get continuously updated data on the volume you pump into a specific area. This lets you analyse the night-time consumption and will enable you to better catch leaks and minimise the water loss.

### Learn more about your distribution network

You can get access to detailed information about your distribution network by installing sensors and reading them through READy Mini Concentrators. You can monitor the pressure in your distribution network by installing one or more pressure sensors. Detailed knowledge about the pressure in the network helps you extend the lifetime of your pipes, lower your energy costs and reduce the loss from leakages\*.

*\* To realise the full benefit of installing pressure sensors, you need the READy Add-on, Priority Meters*

## How to get started

The simple plug and play setup requires no complicated installation or configuration and is implemented with only three simple steps. Then, you can receive data from the chosen meters on a daily or hourly basis or even all the way down to 5-minute intervals\*.

- 1. Buy a READy Mini Concentrator**
- 2. Install the concentrator with power supply and internet access**
- 3. Open READy Manager and import the concentrator like any other network component**

You can now see the READy Mini Concentrator in READy Manager and data from the meters within reach of the READy Mini Concentrator is read automatically.

*\* To provide data with 5-minute intervals you need the READy Add-on, Priority Meters.*

# Think forward
